## HUMAN-HUMAN HYBRIDOMAS FOR NEOPLASMS

BACKGROUND OF THE INVENTIONField of the Invention

The mammalian immune system has a matchless  
5 ability to produce molecules with specificity and  
avidity for a particular spatial and polar structure,  
as may be found with sequences of amino acids and  
sugars. For a long period of time, one was dependent  
upon producing antibodies employing the immune system  
10 in vivo. The resulting polyclonal antibodies  
demonstrated high specificity for a specific antigen,  
but could not discriminate between various sites on the  
antigen and, furthermore, were a mixture of antibodies  
of varying specificity and avidity. thus, one observed  
15 the averaging over the entire composition and not the  
properties of a specific antibody.

With the seminal discovery by Milstein and  
Kohler, one can now produce homogeneous compositions of  
antibodies by fusing a B-lymphocyte with a myeloma cell  
20 to produce a cell referred to as a hybridoma. For the  
most part, the use of this technology has been limited  
to mouse cells, where stable myeloma lines have served  
as fusion partners to provide stable hybridomas which  
can be produced with high efficiency and are capable of  
25 being maintained as productive entities over long  
periods of time. Higher organisms, particularly  
humans, have proven to be much more intractable in  
developing fusion partners and hybridomas. However, in  
1980, the first human fusion partner was reported by  
30 Drs. Olsson and Kaplan and since that time, an  
additional few human fusion partners have been  
reported. Nevertheless, the preparation of hybridomas  
by human-human crosses has remained difficult due to  
problems of efficiency in fusion, culturing the cells,  
35 and maintaining their productive capabilities.  
However, because of the many advantages of having human  
hybridomas which produce antibodies allogenic to a

human host, particularly for in vivo applications, human hybridomas remain of great interest. In other instances, even with the difficulties encountered with human-human crosses, the human hybridoma may be  
5 preferable to a heterogeneic cross, where the resulting hubridoma may lose the genetic information for the monoclonal antibodies after a number of passages.

One of the areas of interest for the use of monoclonal antibodies is in diagnosing and treating  
10 cancer. Monoclonal antibodies for these purposes desirably are specific for a particular type of cancer or subset of cancers, rather than being specific for a particular host cancer cell. it is therefore desirable to develop monoclonal antibodies which can be used in  
15 the diagnosis and treatment of human cancers.

Description of the Prior Art

Nowinski et al., Science (1980) 210:537-539 describe human monoclonal antibodies against Forssman antigen. Corce et al., Nature (1980) 288:488-489  
20 describe human hybridomas secreting antibodies to measles virus. Olsson and Kaplan, PNAS USA (1980) 77:5429-5431 describe human-human hybridomas producing monoclonal antibodies of predefined antigenic specificity as well as the fusion partner employed for  
25 production of the antibodies. See also copending application Serial No. 247,652, filed March 26, 1981.

Schlom, PNAS USA (1980) 77:6841-6845 describes monoclonal antibodies for breast cancer and Sikora, Brit. J. of Cancer (1981) 43:696 describes  
30 separating in situ lymphocytes from a cancer providing antibodies specific for the cancer. In the Proceedings of the 15th Leukocyte Culture Conference, Parker and O'Brien, eds., Wiley Interscience, N.Y., Dec. 5-10, 1982, the subject hybridoma is described. This  
35 abstract is incorporated herein by reference.

SUMMARY OF THE INVENTION

Lymphocytes derived from a neoplastic human host are immortalized by fusion with human fusion partners to provide human x human hybridomas secreting  
5 monoclonal antibodies specific for a neoplastic cell. Particularly, monoclonal antibodies specific for solid tumor cells such as cervical cancer cells are provided for use in diagnostics and therapy.

10      DESCRIPTION OF SPECIFIC EMBODIMENTS

Human monoclonal antibodies specific for neoplastic cells from solid tumors are obtained from human x human fusions employing B lymphocytes, e.g., from lymph nodes draining a solid tumor. Particularly,  
15 lymph nodes are selected which appear to be active based on necrosis of tumor cells in the vicinity of the lymph node in an immunocompetent host.

The draining lymph node(s) may be isolated in conjunction with a variety of human tissue, e.g.,  
20 cervix, mammary, colon, lungs, prostate, skin, etc. Of particular interest are lymph nodes from the spinal area.

The fusion partner may be any convenient immortalized B-cell, which does not secrete  
25 immunoglobulins, individual chains or fragments thereof, can be selected against, as with HAT medium, and desirably has a high fusion efficiency. Illustrative fusion partners are UC729-6, J-4 (SKO-007), and GM1500 6TG-A12.

30      The fusions may be performed as described in the literature employing PEG1500 as fusogen, plating the cells in HAT medium in a plurality of wells and then screening supernatants in the viable cell wells for antibodies of interest. Wells positive for  
35 reactivity are then cloned by limiting dilution and expanded.

Of particular interest are the novel hybridomas CLNH5 and CLNH11, hybridomas obtained from CLNH5 and 11, antibodies derived from such hybridomas, derivatives of such antibodies and the use of the antibodies and their derivatives for diagnosis and therapy. CLNH5 and 11 are obtained by fusion between the fusion partner UC729-6 with lymphocytes from lymph node cells of a patient having cervical cancer. UC729-6 is on deposit at the A.T.C.C. with Accession No. CRL 8061. UC729-6 was deposited for patent purposes in conjunction with the filing of application Serial No. 247,652.

The lymphocytes employed for fusion were from a draining lymph node from the spinal area and peripheral blood lymphocytes from a patient having cervical carcinoma. The fusion is performed by combining the patient's lymphocytes from the lymph node with the fusion partner UC729-6 at a ratio of about 2:1 in a solution of about 35% polyethylene glycol in HEPES buffered RPMI 1640. The mixture of cells is then suspended in appropriate selective medium, particularly HAT medium containing about 10% fetal bovine serum, placed in wells at about  $10^5$  cells per well and a sufficient time permitted for the cells to grow. The selective medium is replaced from time to time.

Wells from the above fusion provided clones specifically reactive with the cervical cancer cells of the host patient which were designated CLNH5 and 11. These wells provided human IgM and IgG monoclonal antibodies, respectively, which react with antigen found on a variety of cervical carcinomas and other tumor cell lines, e.g., small cell carcinoma of the lung, but not with normal tissues and normal cell lines, which were tested.

The hybridomas and monoclonal antibodies can find use in a variety of ways, particularly as sources

of genetic material, as reagents, and as precursors to products which find use as reagents.

The subject hybridomas may be used as a source for genetic material. For example, the subject  
5 hybridomas may be fused with other fusion partners to provide novel hybridomas having the same secretory capabilities as CLNH5 and 11 to provide antibodies having the same specificity. Such fusions may result in the production of antibodies having different heavy  
10 chains so as to provide the other classes or subclasses of antibodies, e.g., G, A or M.

The hybridoma may also be used as a source of DNA, which by hybrid DNA technology, the genes may be excised, introduced into a lymphoma for production of  
15 the mature antibodies.

The monoclonal antibodies can be used in a variety of ways, both in vivo and in vitro diagnosis, as well as in therapy. For many applications; the antibodies will be labeled with a compound which  
20 imparts a desired property to the antibodies, such as providing a detectable signal, providing cytotoxicity, providing for localized electromagnetic radiation, or the like. Labels may include radionuclides, enzymes, fluorescers, toxins or the cytotoxic fragment of  
25 toxins, particles, metals, metalloids, etc. The antibodies may be incorporated in liposome membranes or modified with lipids, so as to be incorporated in such membranes. The antibodies by themselves or labeled, may be used in in vitro diagnosis for measuring the  
30 presence of antigens associated with a neoplasm such as cervical cancer, for in vivo diagnosis for introduction into a host, e.g., intravenously, in a physiologically acceptable carrier, e.g., PBS, or may be introduced for therapeutic purposes in the same manner.

35 The antibodies by themselves or labeled, may also be used for treating a neoplasm in human host such as cervical carcinoma, prostate tumor, colon carcinoma,

lung cancer, breast cancer and melanoma. The antibodies of this invention are easily soluble in physiological saline, and therefore can be injected intravenously or intramuscularly as a saline solution 5 or a drip. Furthermore, the antibodies of the invention can be used in the form of an ointment or suppository.

The amount of antibody employed will vary depending upon the particular application.

10 Introduction of antibodies for diagnostic and therapeutic purposes has been extensively described in literature.

The entire antibody need not be used, for many applications only a fragment having intact 15 variable regions will suffice. For example, Fab fragments,  $F(ab')_2$  fragments, or Fv fragments may suffice.

The following examples are offered by way of illustration and not by way of limitation.

20

#### EXPERIMENTAL MATERIALS AND METHODS

##### Fusion and Selection of Hybridomas.

Lymph nodes were teased with nugen forceps in RPMI 1640 media and isolated lymphocytes were 25 cultured overnight at 37°C and 5% CO<sub>2</sub> in RPMI 1640 with 10% fetal calf serum (FCS) and 2mM L-glutamine. Lymphocytes were counted and mixed at a ratio of 2:1 with the human lymphoblastoid B cell line UC729-6 (Handley and Royston. 1982, in Hybridomas in Cancer 30 Diagnosis and Treatment, eds. Mitchell and Oettgen, pp. 125-132, Raven Press, N.Y.), then fused with polyethylene glycol 1500 by a modification of the technique by Gefter et al., Somatic Cell Genetics (1977) 3:321-336. Fused cells were plated at 10<sup>5</sup> 35 cells/well in a Costar 96 well microtiter plate with

Hypoxanthine-Amethopterin-Thymidine (HAT, Littlefield, Science (1964) 145:709-710) supplemented RPMI 1640 with 10% FCS and L-glutamine. Within 10-20 days, wells positive for hybridoma growth were assayed for human antibody production and their reactivity to a limited human cell panel by an enzyme immunoassay (EIA). Wells positive for reactivity were cloned by limiting dilution without the use of feeder layers and expanded for further study.

10 Enzyme Immunoassay.

Human MoAbs and their reactivity to cells were detected by a modification by an EIA previously described (Handley et al. J. of Immunologic Methods (1982) 54:291-296, as modified by Glassy et al., J. Immunologic Methods (1983) in press). Briefly, 50 $\mu$ l of either an affinity purified goat anti-human Ig or a 4x10<sup>6</sup> target cell/ml suspension was immobilized in triplicate wells of an immunofiltration manifold. (The specifically designed microtiter plate which serves as both an incubation chamber and filtration manifold (VP no. 107; V and P Scientific, San Diego, CA). The bottom of each well contains a 0.6mm hole over which is placed a 6mm diameter glass fiber filter. Surface tension prevents fluid volumes less than 100 $\mu$ l from draining through the hole until a vacuum is applied. When vacuum is applied, fluid is drawn through the filter and out the drain hole leaving particulate matter trapped on the filter. After washing 3x with 0.3% gelatin in phosphate buffered saline, 50 $\mu$ l of hybridoma supernatant were incubated 30 min at room temperature. Filters were then washed and incubated with 50 $\mu$ l of a horseradish peroxidase conjugated goat anti-human Ig for an additional 30 min. Filters were washed again and incubated with 150 $\mu$ l of a 400 $\mu$ g/ml solution of ortho-phenylene diamine in citrate buffer. 100 $\mu$ l of each well were then transferred to a new plate

containing 50 $\mu$ l of 2.5M H<sub>2</sub>SO<sub>4</sub> and read on a Dynatek (Alexandria, VA) MR 580 micro-ELISA reader at 492nm.

Hybridoma culture fluids were precipitated with 50% ammonium sulfate and crude Ig fractions collected. The precipitates were dissolved in physiological saline and purified by affinity chromatography using S-aureus Protein A-bound Sepharose with IgC and Sepharose-(sheep anti(humanIgM) antibody) with IgM. From 1L of the culture fluid of CLNH5, 2.2mg IgM was obtained, while from 1L of the culture fluid of CLNH11, 3.0mg IgG was obtained.

### RESULTS

Table 1 outlines the results of the fusion attempting to produce anti-SCCC (squamous cell carcinoma of cervix) human MoAbs. The fusion producing CLNH5 and CLNH11, human-human hybridomas secreting a MoIgMk and a MoIgG reactive with SCCC cell lines, generated 6 growth positive wells of 80 wells plated. Hybridomas CLNH5 and CLNH11 were cloned and expanded when found to react with the cervical carcinoma cell lines, CaSki and Hela.

TABLE 1

GENERATION AND IDENTIFICATION OF HUMAN MoAbs							
25	Lymph Node draining	#Lymphocytes fused	#Hybridomas generated	#Secreting M G A			#Human reactive
	Cervical Carcinoma (SCCC)	7.0x10 <sup>6</sup>	6	2	1	0	2 (CLNH5 and 11)

30 The relative amounts of human MoAb bound to each of the cell lines listed was measured by EIA.

Antibody (IgM) secreted by CLNH5 shows positive reactivity with carcinomas of the cervix (CaSki, Hela), lung (T293, Calu-1, and SK-MES-1), 35 melanoma (SK-MEL-28), and prostate (LnCap) and was

negative for normal fibroblasts, T lymphocytes and peripheral blood lymphocytes. Antibody (IgG) secreted by CLNH11 shows positive reactivity with carcinomas of the cervix (CaSki, Hela), prostate (PC-3), breast 5 (ZR-76-1), colon (COLO-205) and melanoma (G-361) and was negative for normal fibroblasts (WI-38 and MRC-9), T. lymphocytes and peripheral blood lymphocytes.

The cytobiochemical properties of the hybridomas of the present invention are shown below.

10        Hybridoma CLNH5:-

(1) Number of chromosomes: 60 to 90 (maximum frequency 80).

(2) It secretes human immunoglobulin M (IgM).

15        (3) Doubling time: 30-40 hours.

(4) Lymphocytic single cell.

(5) Its DNA content is at least two times, for example, 2 to 2.5 times, that of normal human lymphocytes.

20        (6) IgM binds to human cervical carcinoma cells and the other carcinomas mentioned above.

In addition, the above hybridoma CLNH5 can be proliferated in HAT medium (medium containing hypoxanthine, amethopterin and thymidine).

25        Hybridoma CLNH11:-

(1) Number of chromosomes: 60 to 90 (maximum frequency 80).

(2) It secretes human immunoglobulins G (IgG).

30        (3) Doubling time: 30-40 hours.

(4) Lymphocytic single cell.

(5) Its DNA content is at least two times, for example 2 to 2.5 times, that of normal human lymphocytes.

35        (6) IgG binds to human cervical carcinoma cells, and the other carcinomas mentioned above.

In addition, the above hybridoma CLNH11 can be proliferated in HAT medium.

The relative DNA content (the ratio to the DNA content of normal human lymphocytes) was determined  
5 by a method which comprises dyeing the hybridoma and then separating and analyzing it by a cytofluorometer.

The properties of the monoclonal human immunoglobulines in accordance with this invention are shown below.

5                    Monoclonal Human Immunoglobulin  
                    Produced by the Hybridoma CLNH5

- (a) It is human immunoglobulin M (IgM).
- (b) It has a stronger binding affinity to  
10 cell lines, Hela and CaSki, than to normal fibroblasts (WI-38).
- (c) It does not react with human red blood cells, nor shows an agglutination reaction on human red blood cells.
- (d) It is composed of heavy chains (H  
15 chains) and light chains (L chains), has a molecular weight of about 180,000 (monomer), and exists as a pentamer in the culture fluid.

Monoclonal Human Immunoglobulin  
                    Produced by the Hybridoma CLNH11

- 20 (a) It is human immunoglobulin G (IgG).
- (b) It has a stronger affinity to cell lines, Hela and CaSki, than to normal fibroblasts (WI-38).
- (c) It does not react with human red blood  
25 cells, nor shows an agglutination reaction on human red blood cells.
- (d) It is composed of H chains and L chains and has a molecular weight of about 150,000.

The binding activity of human monoclonal antibodies distinguishing neoplastic cells from normal cells was measured as follows:

An original human tissue section including  
5 carcinoma cells and normal cells was fixed on a glass plate by glutaraldehyde, and then stained by enzyme immunoassay according to the method of Sternberger et al. J. Hist. Cyto. 18 315 (1970).

The subject monoclonal antibodies are useful  
10 for the diagnosing, imaging and potentially for treating cervical carcinoma as well as other reactive tumors. Because of the specificity of the monoclonal antibodies over a range of cervical carcinomas from different hosts, the subject antibodies can be used in  
15 different hosts, rather than solely with the host source of the antigen. Because the subject antibodies are human, they are less likely to produce a significant immune response when employed in in vivo diagnosis or therapy.

20 Although the foregoing invention has been described in some detail by way of illustration and example for purposes of clarity of understanding, it will be obvious that certain changes and modifications may be practiced within the scope of the appended  
25 claims.

## WHAT IS CLAIMED IS:

1. Human monoclonal antibodies capable of distinguishing human neoplastic cells from the corresponding normal human cells.
- 5           2. Human monoclonal antibodies according to claim 1 capable of distinguishing human solid tumor cells from the corresponding normal human cells.
3. Human monoclonal antibodies according to claim 1 capable of distinguishing human cervical  
10 carcinoma cells from normal human cervical cells.
4. Human monoclonal antibodies according to claim 3, obtained from a human hybridoma CLNH5 or hybridomas derived from CLNH5.
5. Human monoclonal antibodies according to  
15 claim 3, obtained from a human hybridoma CLNH11 or hybridomas derived from CLNH11.
6. Human monoclonal antibodies according to any one of the preceding claims 1 to 5 or fragments thereof labeled with a label capable of providing a  
20 detectable signal.
7. Human monoclonal antibodies according to claim 6, wherein said label is a radionuclide.
8. Human monoclonal antibodies according to any one of the preceding claims 1 to 5 or fragments  
25 thereof labeled with a toxin.
9. Human hybridomas having genes from the same human neoplastic host lymphocytes or human hybridomas derived therefrom.

10. Human hybridomas or human hybridomas derived therefrom according to claim 9, wherein the human neoplastic host is a human solid tumor host.

11. Human hybridomas or human hybridomas  
5 derived therefrom according to claim 10, wherein the human solid tumor host is a human cervical carcinoma host.

12. Human hybridomas CLNH5 or CLNH11 according to claim 11.

10 13. A method for determining the presence of a neoplasm which comprises:

combining a sample from a host suspected of having a neoplasm with monoclonal antibodies according to any one of the preceding claims 1 to 5 or fragments  
15 thereof, or said antibodies or fragments labeled with a label capable of providing a detectable signal, and  
detecting the presence of the binding of said monoclonal antibodies or fragments thereof, or said  
antibodies or fragments labeled with a label capable of  
20 providing a detectable signal to their homologous antigen.

14. A method according to claim 13, wherein said sample is host tissue.

15. A method according to claim 13, wherein  
25 said neoplasm is a solid tumor.

16. A method according to claim 15, wherein said solid tumor is a cervical carcinoma, prostate tumor, colon carcinoma, lung cancer, breast cancer or melanoma.

17. A method for producing human monoclonal antibodies specific for neoplastic cells as distinct from normal cells and free of non-human antigens, which comprises:

- 5 fusing B-lymphocytes from human lymphnodes, human lymph glands, human bone marrow, human spleen or human blood, associated with a neoplasm in a human host with a human fusion partner to produce hybridomas; cloning said hybridomas to produce individual  
10 clones; screening said clones for monoclonal antibodies specific for said tumor cells and tumor cells from the same tissue from other hosts; and growing said specific clones, whereby said  
15 monoclonal antibodies are produced.

18. A method according to claim 17, wherein said neoplasm is a solid tumor in a human host.

19. A method for producing monoclonal antibodies specific for solid tumor cells as distinct  
20 from normal cells and free of non-human antigens, which comprises:

growing cells according to claim 12.

20. A method according to claim 19, wherein said tumor is a cervical carcinoma.

8

V. ☐ OBSERVATIONS WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE <sup>10</sup>

This international search report has not been established in respect of certain claims under Article 17(2) (a) for the following reasons:

1. ☐ Claim numbers \_\_\_\_\_, because they relate to subject matter <sup>13</sup> not required to be searched by this Authority, namely:

2. ☐ Claim numbers \_\_\_\_\_, because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out <sup>13</sup>, specifically:

VI. ☐ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING <sup>11</sup>

This International Searching Authority found multiple inventions in this international application as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims of the international application.

2. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims of the international application for which fees were paid, specifically claims:

3. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:

Remark on Protest

- ☐ The additional search fees were accompanied by applicant's protest.  
☐ No protest accompanied the payment of additional search fees.
